Cited document of particular relevance:

D1: WO 03013383 A1

D1 shows an implant, which is exposed to impinging forces in a jaw bone, according to the preamble of claim 1. The implant comprises peripherally extending surfaces (162, 172, 181, figures 16-18) which can be placed against a jaw bone part. Each surface is provided with a pattern of grooves (160, 170, 180), which extend substantially at right angles to, and if appropriate parallel to, said forces when these assume principal directions differing from the longitudinal direction of the implant.

The implant according to claim 1 therefore is known from D1. Consequently, the invention defined in claim 1 lacks novelty and inventive step.

The arrangements according to claims 2-16 are also previous known from D1. Consequently, claims 2-16 also lack novelty and inventive step.

The invention is considered to be industrially applicable.
